

# Insect Pests of Food Establishments

Bobby Corrigan, Ph.D.

NEHA

Tucson, Arizona

June 2008

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

**Every food establishment  
will experience some pest  
activity:**

**Why?**

---

---

---

---

---

---

---

---

**Odors, water, heat,  
deliveries, traffic,  
abundant  
putrescible trash,  
abundant food prep  
and storage.**

---

---

---

---

---

---

---

---

**Food Safety  
(right?)**

---

---

---

---

---

---

---

---

**Examples:**

**Supermarkets  
Convenience Stores  
Restaurants  
Schools, etc.**

---

---

---

---

---

---

---

**Insect Pests of Health Significance in  
Food Handling Environments**

**Filth Flies**

1. Small flies  
(e.g., fruit flies phorid)
3. G. cockroaches
4. A. cockroaches

---

---

---

---

---

---

---

**Large Flies  
Small Flies**

---

---

---

---

---

---

---

# Filth Flies

1. Common house fly

2. Blow flies

---

---

---

---

---

---

---

---

---

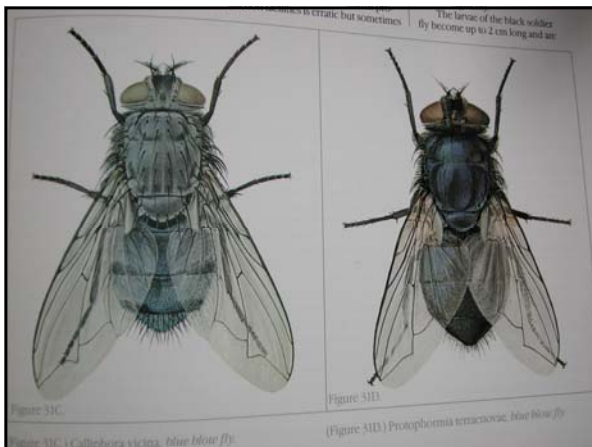

---

---

---

---

---

---

---

---

---

---

---

---

**Animal feces**  
**Sputum**  
**Scum**  
**Decaying flesh**  
**Decaying food**  
**Organic soup slime**

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

**Not all drains are  
equal:  
broken tiles;  
drain seat;  
food**

---

---

---

---

---

---

---

---

### **Drains:**

- a near compactor**
- b. near dairy**
- c. in deli**
- d. in produce**

---

---

---

---

---

---

---

---

**Not the Drain  
itself**

**The Drain  
Structure**

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

**Even if there isn't  
anything to find...**

**Just doing the drain  
inspection.....**

**(HO/PMP)**

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

**The slop sinks**  
**Closets.....**

---

---

---

---

---

---

---

---

**It is understandable  
there can be a few flies inside a  
large food establishment during  
the summer months**

**But.....**

**Deli, fast food, etc.....**

---

---

---

---

---

---

---

**Fly control during the  
summer requires  
formal efforts (i.e.\$)  
not simply putting out  
some fly lights**

---

---

---

---

---

---

---

**Fly zappers  
do not control  
infestation  
sources**

---

---

---

---

---

---

---

## Dumpsterology

1. Type
2. Location, location, location
3. Training for staff
4. Proper cleaning of dumpster pad and proximity.

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

It truly seems  
H. sapiens is incapable  
of not overfilling their  
trash receptacles.

---

---

---

---

---

---

---

### Cockroaches:

- 1. In kitchen/dining areas:**  
German cockroach
- 2. Basements, drains:**  
American cockroaches  
("those big suckers")

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

Shine a light  
into cracks and  
crevices of **warm**  
areas nearby  
sources of **water;**

---

---

---

---

---

---

---

---

---

---

---

---

---

---

# American cockroach

“those big suckers in  
the basement”

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

# Beetles and Moths Inside Food Facilities

---

---

---

---

---

---

---

---

---

---

---

---

---

---

## Beetle life cycles: Egg, larva, pupa, adult

Time to complete:

3 wks-several months

(temp, humidity and food)

**50-60 days is an OTJ average.**

---

---

---

---

---

---

---

## Moth vs. Beetle Larvae

---

---

---

---

---

---

---

---

## Moths

### Indian meal moth

1. Mediterranean flour moth
2. Angoumois moth

Wee

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

### Indianmeal Moth Larvae

---

---

---

---

---

---

---

---

### Moth life cycles:

**Egg, larva, pupa, adult**

**Time to complete:**

**4 wks-several months**

**(temp, humidity and food)**

**40-50 days is an OTJ average.**

---

---

---

---

---

---

---

---

**Controlling beetles and  
moths inside food  
related facilities:**

---

---

---

---

---

---

---

---

**Three things:**

**1. Sanitation is pest control;**

**2. Rotation of stock**

---

---

---

---

---

---

---

Macrosanitation

Macroinspections

Microsanitation

Microinspections

Consider the sizes: larvae of fruit flies, sawtooth grain beetles, mites and brick veneers, cockroach nymphs, and relative giants: (a house mouse (6mm))

---

---

---

---

---

---

---

**Rotation**

**Rotation**

**Rotation**

**Of all spices, flours, cereals**

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

**3. There is little a pest professional can do with any treatments;**

**Their role is source identification and guidance (e.g., what out of sight areas require cleaning).**

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

## BEE, WASPS and HORNETS

All bees and wasps are beneficial.

Should not be removed unless:

- direct damage by their nesting activity
- stinging threat in or around structures and areas of high human activity

---

---

---

---

---

---

---

## Yellow Jacket Wasps (*Vespula* sp.)

Most active late summer – fall around food

<http://www.ent.orst.edu/urban/yellowjackets.html>

---

---

---

---

---

---

---

## Yellow Jacket Biology

- Yellow jackets are heavy-bodied wasps, black with yellow or white markings, about 1/2 inch long.
- They live in grey, papery nests located either below ground, or suspended above ground in vegetation. The nests have only a single opening.
- Hunting “workers” search for prey, carrion or rotting fruit, and are attracted to any meat or sugary item. Food is carried back to the nest where it is fed to nest mates.
- Stings usually occur through accidental contact with the nest or nest entrance.

---

---

---

---

---

---

---

## Control of Yellow Jacket Nests

**Insecticidal Treatment** If problem nests can be located, usually by worker activity around nest entrances, treat at dusk with an approved “wasp & hornet” aerosol insecticide. Treat directly into the nest opening. For ground nests, seal the nest entrance with rock or soil. Do not pour flammable liquids into nests.

**Poison Baits** and/or **Non-Toxic Traps** may also be effective under certain circumstances – follow directions closely.

**Likely Problem Areas:** Dumpsters, and other trash holding containers in places like parks or recreational areas. Picnic/camping sites.

---

---

---

---

---

---

---

---

## Nuisance Ants

### Problem species:

Argentine Ant, *Iridomyrmex humilis*

Pharaoh Ant, *Monomorium pharaonis*

...and many others, depending on geographic location

Control: species differences, so identification is helpful...treat trails, baits, insecticidal sprays, indoor vs. outdoor treatment

---

---

---

---

---

---

---

---

## House-infesting Ants

Argentine ant

Longspined  
Harvester  
ant

Western  
Bigheaded  
ant

*Iridomyrmex  
pruinus*

Jetblack  
Harvester  
ant

California  
Acrobat  
ant

### One “node” vs Two

---

---

---

---

---

---

---

---

California Acrobat Ant

Pharaoh ants at suger

---

---

---

---

---

---

---

---

### Mites Infesting Stored Foods

	Common Name	Scientific Name	
	Grain Mite	<i>Acarus siro</i>	
	Mold Mite	<i>Tyrophagus putrescentiae</i>	
	Cheese Mite	<i>Tyrolichus casei</i>	

---

---

---

---

---

---

---

---

Mites can infest stored foods and other organic debris, including:

grain, flour, cereals, dried fruits and vegetables, pet foods, cheese, dried milk, ham, sugar, paper, tobacco, molds, bird and animal nests, etc.

These mites often prefer a moist, damp location.

Sometimes the surface of infested material appears to move due to the enormous numbers of mites (barely visible to the unaided eye).

---

---

---

---

---

---

---

---

A coating or piles of brownish "mite dust" may appear on open shelving, around the base of flour sacks, on the surface of cheese or in other foods.

This "dust" is dead and living mites, cast skins and feces.

Prolonged contact with mite infested foods may produce a mild dermatitis known as "baker's" or "grocer's itch."

Other contact may cause bronchial asthma and dust allergies. Also, if mites are taken internally with infested food, stomach disorders may result.

---

---

---

---

---

---

---

MITE CONTROL =

Inspection

Rotation

Sanitation

1903 – The first science documentary
